MySQL DB implementation

FICHA

Consider the following database schema, which will allow you to manage the employees of a company:

1. Create, in MySQL, the database **company_test**;

2. Implement the above database schema, with the following characteristics:

employee

employee_id	INT(4), auto incremental	Univocal identifier of each employee
Employee_name	VARCHAR(30), Not Null	Employee's name
birth_date	DATE	Employee's date of Birth
salary	INT	Employee's salary Validation rule: >800 and < 3000
postalcode_id	VARCHAR(8)	Postal code
admission_date	DATE	Date of admission to the company
nif	INT, Not null	No. of taxpayer Validation rule: it must be unique
department_id	INT	Code of the department where you work

postalcode

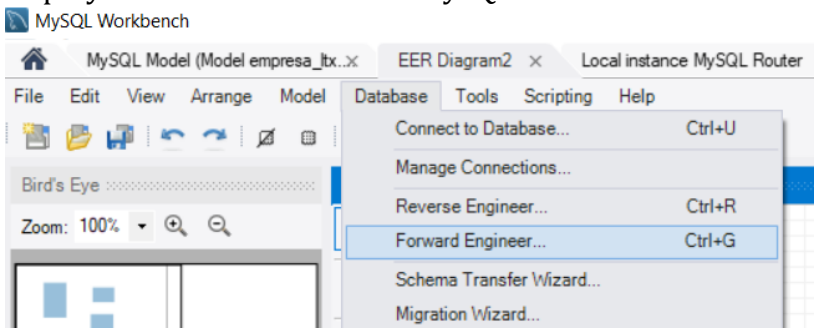

postalcode_id	VARCHAR(8)	Postal code
locality	VARCHAR(30)	Name of town

department

department_id	INT	Univocal identifier of each department
name	VARCHAR(30)	Name of the town
budget	INT, Not null	Department budget Validation rule: between 0 and 10.000

3. Establish the necessary relationships (foreign keys) to obtain the database schema presented above.

4. Deploy the database model in MySQL

5. Fill in the entities/tables with some records.
