Databases

UNIDADE CURRICULAR

Triggers

FICHA

Consider the video_platform database used in previous exercises:

1. Create a trigger (***tInsertFilmYearLess2000***) that prevents the insertion of films (entity *filme*) prior to the year 2000
   (if attribute *ano* contains a value less than 2000, set this attribute to 2000).

2. Create a trigger (***tInsertFilmCurrentYear***) that, before inserting a record on the *filme* table, validates the value of the year (*ano*) attribute: if it is higher than the current year, it must assume the current year by default.

TIP:

```
if new.ano > year(curdate()) then
      set new.ano = year(curdate());
```

3. Create a trigger (***tInsertFilmDataLimite***) that every time you insert a film in the database (entity *filme*), the viewing deadline (*data_limite* attribute) is the current date + 30 days.

4. When editing a movie, trigger (***tUpdateFilmDuracao***) an event that validates if the attribute *duracao* is less than 30 or greater than and 180 (minutes), is assumes these limit values.

5. Create a set of triggers that allow you to record in a log_table entity all the operations for inserting, editing and removing data in the *filme* table.
