Stored Procedures

FICHA

1. Consider the video_platform database.

1.1 Create a stored procedure (**GetFilmsByGenre**) that shows the films (id_filme and titulo) of a certain genre indicated as input;

1.2 Create a stored procedure (**GetFilmsByAtor**) that shows the films (id_filme and titulo) where a certain actor enters (indicated as input);

1.3 Create a stored procedure (**GetNumberFilmsByYear**) that returns the number of films for the year 2015;

1.4 Adapt the previous stored procedure (**GetNumberFilmsByYear**) so that it returns the number of films for a given year indicated as an input;

1.5 Create a stored procedure (**GetNumFilmsByGenre**) that returns the number of films of a given genre indicated as input;

1.6 Create a stored procedure (**GetFilmesByYears**) that shows the films published between two dates (indicated by parameters);

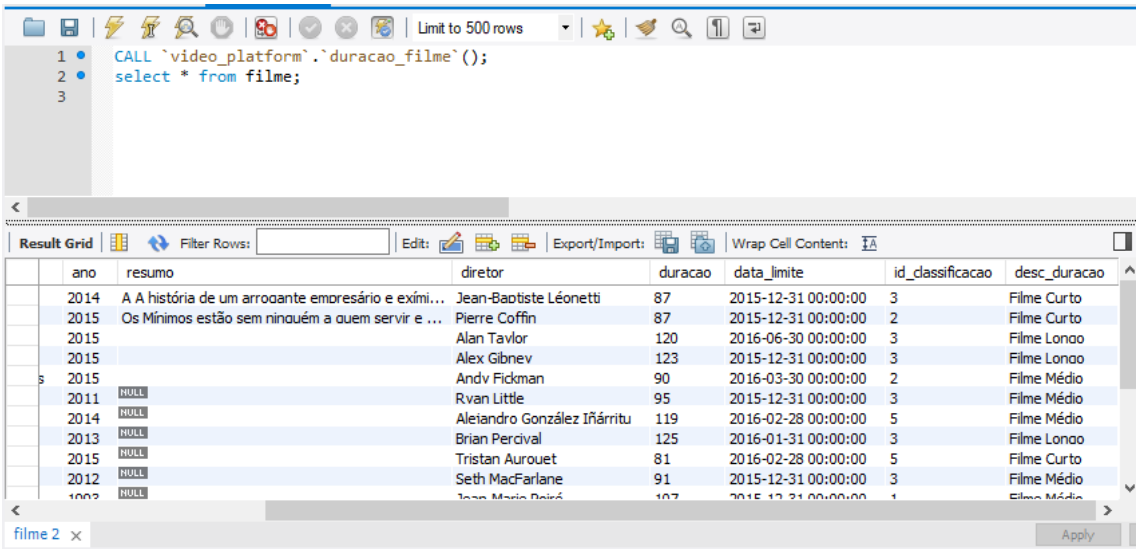

1.7 Create a Stored Procedure (**SetClassificationFilms**) that changes the movie entity, adding a new column: **desc_duracao, of type VARCHAR (20);**
The stored procedure must process all the records of the movie entity, and classify them in the new column (**desc_duracao**), according to the content of the duration column, as follows:

Film length <90 => desc_duration = “Short Film”

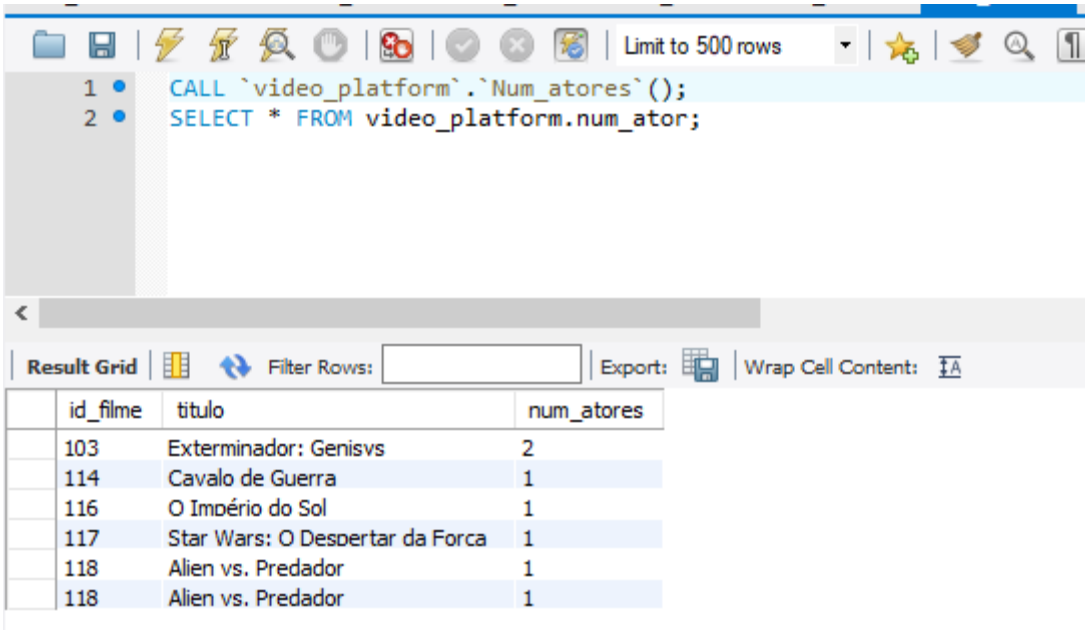

Film length 90-120 => desc_duration = “Medium Film”

Film length> = 120 => desc_duration = “Long Film”

The final result, in the movie entity should be as follows:

1.8 Create a stored procedure (**SetNumAtorsByFilm**) that allows creating a table (num_ator) with the number of actors per film, as shown in the image below:

id_filme	titulo	num_atores
103	Exterminador: Genisvs	2
114	Cavalo de Guerra	1
116	O Império do Sol	1
117	Star Wars: O Despertar da Forca	1
118	Alien vs. Predador	1
118	Alien vs. Predador	1
